

09/754,554

Amendments to the Claims:

1. (previously presented) A method comprising:
automatically sending a discovery message to a node;
enabling node access if a response to the discovery message is received; and
automatically checking a link to the node to make sure that the node is still accessible.
2. (original) The method of claim 1 including implementing a state machine with a connected and a disconnected state and automatically transitioning from the disconnected state to the connected state when a response to a discovery message is received.
3. (original) The method of claim 1 including notifying a client wishing to access a node when a state transition is made based on a response to a discovery message being received.
4. (cancelled)
5. (previously presented) The method of claim 1, including automatically checking said node at timed intervals in order to maintain a connected state.
6. (original) The method of claim 1 further including automatically sending a message to determine whether the node is still accessible after said response to said discovery message is received.
7. (currently amended) An article comprising a medium storing instructions that enable a processor-based system to:
automatically send a discovery message to a node in response to a request to access the node;
enable node access if a response to the discovery message is received; and
automatically check a link to the node to make sure that the node is still accessible.

09/754,554

8. (original) The article of claim 7 further storing instructions that enable the processor-based system to implement a state machine with a connected and a disconnected state and to automatically transition from the disconnected state to the connected state when a response to a discovery message is received.

9. (original) The article of claim 7 further storing instructions that enable the processor-based system to notify a client wishing to access a node when a state transition is made based on a response to a discovery message being received.

10. (cancelled).

11. (previously presented) The article of claim 7, further storing instructions that enable the processor-based system to automatically check the node at timed intervals.

12. (original) The article of claim 7 further storing instructions that enable the processor-based system to automatically send a message to determine whether the node is still accessible after said response to said discovery message is received.

13. (previously presented) A system comprising:
a network interface; and
a storage coupled to said network interface, said storage storing instructions that enable said system to automatically send a discovery message to a node over said interface to access the node and to enable node access if a response to the discovery message is received, said storage further storing instructions that enable said system to automatically check said node at timed intervals in order to maintain a connected state.

14. (original) The system of claim 13 wherein said system is a processor-based system.

09/754,554

15. (original) The system of claim 13 wherein said storage stores instructions to cause said system to automatically send a message to determine whether the node is still accessible after said response to said discovery message is received.
